

ABSTRACT

In a laser light source device (2), a light source unit (11) has one condenser lens (14) for condensing a laser beam emitted from one semiconductor laser (12), another condenser lens (15) for condensing a laser beam emitted from another semiconductor laser (13), and a focusing lens (17) for focusing and projecting the
5 laser beam condensed by one condenser lens and the laser beam condensed by another lens onto an incident face (16a) of one light guiding means.
